1. About the CHIS 2003 Adult Survey Public Use File

The CHIS 2003 Adult Survey Public Use File (PUF) is a data file consisting of individual records from the adult component of the 2003 California Health Interview Survey. It is a free product provided by the CHIS project to researchers and data analysts for use in health-related research.

Users of the Adult Survey PUF must register and also sign a confidentiality agreement before the file can be downloaded or delivered by mail. This agreement commits the user to make appropriate use of these data and take precautions to protect respondent confidentiality.

The Adult Survey PUF can be used only for statewide and urban-rural estimates and not for local-level (sub-state) estimates. County identification and zip code information has been intentionally excluded to reduce the risk of respondents being identified. Additional confidential survey information that is not accessible in the Adult Survey PUF is available through the Data Access Center. Such confidential information includes sub-state geographic variables (e.g., county), highly sensitive variables (e.g., sexual behavior), and household identifiers to link the adult, child and adolescent files.

CHIS sample weights (based on the 2003 California Department of Finance population projections) are included in the files. The imputation flags for CHIS source variables are also included in a separate data file. A complete data dictionary with a description of survey methods and a description of how to use the sample weights accompanies these files. Limited technical assistance is also available from CHIS – please send email to chis@ucla.edu.

2. CHIS 2003 Design and Methodology Summary

2.1 Overview

The 2003 California Health Interview Survey (CHIS 2003) is a collaborative project of the UCLA Center for Health Policy Research, the California Department of Health Services, and the Public Health Institute. CHIS collects extensive information on health status, health conditions, health-related behaviors, health insurance coverage and access to health care services. CHIS is a population-based, random-digit dial (RDD) telephone survey of California households. Within each household, separate interviews were conducted with a randomly selected adult (age 18 and over), adolescents (ages 12-17), and parents of children (ages 0 to 11). CHIS 2003 is the second CHIS data collection cycle (following CHIS 2001) and was conducted between August 2003 and February 2004.

Many State agencies, local public health agencies and organizations, federal agencies, advocacy and community organizations and agencies, foundations and researchers use CHIS data and results. They use these data in their own analyses and publications to assess public health and health care needs, to develop health policies, and to develop and advocate policies to meet those needs (for examples of these extensive uses, visit www.chis.ucla.edu/promo). Many researchers throughout California and the rest of the nation use CHIS data files to further their understanding of a wide range of health-related issues (for many examples of these studies, visit the CHIS Research Clearinghouse: www.chis.ucla.edu/rc).

CHIS 2003 received funding from the California Department of Health Services, The California Endowment, the National Cancer Institute, the Robert Wood Johnson Foundation, the Centers for Disease Control and Prevention, the California Office of Patient Advocate, the LA Care Health Plan, Kaiser Permanente, and the Alameda County Health Care Services Agency.

2.2 Sample Design Objectives

The CHIS sample is designed to meet two objectives: 1) provide estimates for counties and groupings of counties; and 2) provide estimates for California's overall population and its larger race/ethnic groups, as well as for several smaller ethnic groups.

To achieve its sample objectives, CHIS relied on a complex sample design. The state was divided into 41 geographic sampling strata, including 33 single-county strata and eight additional strata comprised of 25 primarily small counties. Within each geographic stratum, telephone numbers were sampled using a random-digit dial (RDD) method. Table 1-1 shows the 41 geographic CHIS sampling strata. A sufficient amount of sample was allocated to each stratum to support the first sample design objective. These strata were also used for the CHIS 2001 sample and allow for a comparison of population trends. Due to funding limitations, the sample sizes allocated to most strata for CHIS 2003 were smaller than in the 2001 administration.

Table 1-1. California County and County-Group Strata in CHIS 2003 Sample Design

1. Los Angeles	15. San Joaquin	29. El Dorado
2. San Diego	16. Sonoma	30. Imperial
3. Orange	17. Stanislaus	31. Napa
4. Santa Clara	18. Santa Barbara	32. Kings
5. San Bernardino	19. Solano	33. Madera
6. Riverside	20. Tulare	34. Monterey, San Benito
7. Alameda	21. Santa Cruz	35. Del Norte, Humboldt

The samples in Los Angeles and Alameda Counties were enhanced through additional, county-specific funding to allow sub-county geographic estimates. Specifically, LA Care Health Plan funded additional sampling in Los Angeles at the Service Planning Area (SPA) level; and the Alameda County Public Health Department funded an oversampling in Alameda, for the cities of Oakland and Hayward, as well as the remainder of the county. These samples were incorporated into the design of the statewide RDD sample.

To accomplish the second objective, sufficient sample sizes were allocated to the more urban counties, where the majority of the state's Latino, African-American and Asian ethnic populations reside. To increase the precision of estimates for Koreans and Vietnamese, these two groups were over-sampled using a combination of geographic targeting and a surname-listed sample.

2.3 Data Collection

To capture the rich diversity of the California population, interviews were conducted in five languages: English, Spanish, Chinese (Mandarin and Cantonese dialects), Vietnamese and Korean. These languages were chosen based on research that identified the languages that would cover the largest number of Californians in the CHIS sampling frame that did not speak English well enough to otherwise participate.

Westat, a private firm that specializes in statistical research and large-scale sample surveys, conducted the CHIS 2003 data collection. Westat staff interviewed one randomly-selected adult in each sampled household. In those households with children (under age 12) or adolescents (ages 12-17) associated with the sampled adult, one child and/or one adolescent were randomly selected, so up to three interviews could have been completed in each sampled household. The sampled adult was interviewed, and the parent or guardian most knowledgeable about the health and care of the sampled child was interviewed. The sampled adolescent responded for him or herself after a parent or guardian gave permission for the interview.

Proxy interviews were also allowed for frail and ill persons over the age of 60. For 171 elderly adults, either the spouse/partner or adult child of these elderly adults completed a proxy interview. Only a subset of questions identified as appropriate for a proxy respondent were administered.

Prior to the interview contact, telephone numbers for which addresses could be found were mailed advance letters to inform household members about the survey. Table 1-2 shows the number of completed adult, child and adolescent interviews in CHIS 2003, by the type of sample (RDD or supplemental sample).

Table 1-2. Number of Completed CHIS 2003 Interviews by Type of Sample Instrument

Type of Sample	Adult	Adolescent	Child
RDD	41,818	3,996	8,480
Supplemental Samples:			
Korean	112	6	24
Vietnamese	114	8	22
Total RDD + Supplemental Samples	42,044	4,010	8,526

Source: UCLA Center for Health Policy Research, 2003 California Health Interview Survey.

Interviews done in all languages were administered using Westat's computer-assisted telephone interviewing (CATI) system. The average adult interview took 33 minutes to complete. The average child and adolescent interviews took 14 and 21 minutes, respectively. Interviews in the non-English languages generally took longer to complete. Approximately 11% of the adult interviews were completed in a language other than English, as were 21% of the child (parent proxy) interviews and 7% of the adolescent interviews.

2.4 Response Rate

As a multi-stage survey, several response rates can be calculated, including the screener response rate, adult response rate, child response rate, adolescent response rate and overall response rate. The CHIS 2003 response rates were calculated using the American Association for Public Opinion Research (AAPOR) methods. The screener response rate is the proportion of eligible residential households in which a screener interview was completed. This rate is calculated and weighted to account for differential sampling rates within geographic stratum and for the sub-sampling of households for refusal conversion. The number of eligible residential households is based on an estimate using the "survival" method and produces a conservative response rate. Statewide rates are subsequently calculated using weighted averages of the response rate for each stratum. Using these methods, the CHIS 2003 screener response rate was 55.9%.

The extended interview response rate is the proportion of selected respondents within households who successfully completed the interview. If an adult finished at least 80% of the questionnaire, then that was counted as a completed interview. For CHIS 2003, the adult extended interview response rate was 60%. For the child sample, the extended interview response rate was 81.4% and for the adolescent extended interview it was 57.3%. For the adolescent interview, if those who did not respond because their parents did not give permission were excluded, the rate rises 26 percentage points to 83.3%. The overall response rate for CHIS 2003 administration is calculated by multiplying the screener response rate by the adult extended response rate and is 33.5%. Response rates varied by sampling stratum and were slightly higher in households that received an advanced letter.

The CHIS response rates are comparable to response rates of other scientific telephone surveys in California, such as the California Behavioral Risk Factor Surveillance System (BRFSS) survey. Comparing survey response rates is, however, complicated and confusing as a result of the use of different definitions and varying methods of calculation. Professional groups such as the Council of American Survey Research Organizations (CASRO) and the American Association for Public Opinion Research have attempted to standardize the concepts and methods of calculating response rates. Despite this, there are numerous methods to calculate response rates, with each equation potentially delivering a different answer. Furthermore, California as a whole, and the

state's urban areas in particular, are among the most difficult parts of the nation in which to conduct telephone interviews. Survey response rates tend to be lower in California than nationally, and over the past decade response rates have been declining both nationally and in California.

While important, the response rate of a survey is not the only, or even the best, measure of its quality. One approach to examining survey quality and potential bias is to examine how well the survey respondents match the demographic characteristics of the population. CHIS 2003 data are being benchmarked to California Department of Finance 2003 data. See www.chis.ucla.edu for further information.

An additional way to assess whether a survey is representative is to compare its findings with those of other similar surveys, or to benchmark CHIS data. CHIS 2003 data are being benchmarked to National Health Interview Survey data, Medical Expenditure Panel Survey data, and BRFSS data for California to better assess how representative it is compared to other widely accepted population surveys. Some of these other surveys, such as NHIS or MEPS, are administered in person and have higher response rates. See www.chis.ucla.edu for additional information.

2.5 Weighting the Random Digit Dial Sample

To produce population estimates for the CHIS samples, CHIS 2003 data were statistically weighted to account for the differential chance of selecting a person into the sample, and the weights were then adjusted to more closely match the actual non-institutionalized California population for each geographic sampling stratum statewide. Specifically, sample weighting was carried out in CHIS 2003 to accomplish the following objectives:

- To compensate for differential probabilities of selection for households and persons (Note: telephone numbers for which addresses could be found and advance letters mailed were assigned a higher probability of selection than those without addresses)
- To reduce biases occurring because non-respondents may have different characteristics than respondents
- To adjust, to the extent possible, for under-coverage in the sampling frames and in the conduct of the survey
- To reduce the variance of the estimates by using auxiliary information

One set of weights was created for each CHIS 2003 data file (adult, child and adolescent). Each data file includes the RDD and Korean and Vietnamese surname list samples. These weights can be used to produce estimates at the state and stratum (county or group of counties) level. The weight variable for every case is the result of a series of sequential adjustments made, using the base weights.

As part of the weighting process, a household weight was created for all households that completed the screener interview. This household weight is the product of the “base weight” or the inverse of the probability of selection of the telephone number and adjustment factors computed for the following weight adjustments:

- Sub-sampling for numbers with addresses
- Multiple chances of being selected in the RDD and supplemental samples
- Unknown residential status
- Sub-sampling screener refusals for conversion attempt
- Screener interview non-response
- Multiple telephone numbers
- Household post-stratification

The resulting post-stratified household weight was used to compute a person-level weight. This person-level weight includes weight adjustments for the within-household sampling of persons and non-response.

The final step is to adjust the person-level weight using a raking method so that the CHIS estimates are consistent with population control totals for the state, and for each geographic stratum in which samples were drawn. Raking is an iterative procedure that forces the CHIS weights to sum to known totals based on external data sources. The procedure requires iteration to make sure all the control totals or dimensions of raking are simultaneously satisfied (within a specified tolerance). The control totals or raking dimensions used in CHIS 2003 were created from the 2003 California Department of Finance estimates of the numbers of persons by age, race, and sex, and from the 2000 Census of Population counts from the U.S. Census Bureau. Seven variables were used in the post-stratification procedure to determine the final person weight: age, gender, race, ethnicity, geographic stratum (i.e., city, county, strata and state), education and home ownership. The 14 raking dimensions are combinations of demographic variables (age, sex, race and ethnicity), geographic variables (county, city and, in Los Angeles County, Service Planning Area), household composition (presence of children and adolescents in the household) and socio-economic variables (home ownership and education). The socio-economic variables are included to reduce biases that are associated with excluding households without a telephone number from the survey.

2.6 Imputation Methods

There are two imputation procedures used by Westat to fill in missing responses for items in CHIS 2003 that are essential for weighting the data. The first imputation technique is a completely random selection from the observed distribution of the respondents. This method is used only for a few items when the percentage of the missing items is very small. For example, when imputing the missing values for self-reported age—which had a very low item non-response rate—the distributions of the responses for age by type of interview (adult, child or adolescent) are used to randomly assign an age using probabilities associated with these distributions.

The second technique is hotdeck imputation without replacement. The hotdeck approach is probably the most commonly used method for assigning values for missing responses in large-scale household surveys. With a hotdeck, a value reported by a respondent for a particular item is assigned or donated to a “similar” person who did not respond to that item. To carry out hotdeck imputation, the respondents to an item form a pool of donors, while the non-respondents are a group of recipients. A recipient is matched to the subset pool of donors, with the same household structure. The recipient is then randomly imputed the same value for the variable from one of the donors in the pool. Once a donor is used, it is removed from the pool of donors. Hotdeck imputation was used to impute race, ethnicity, home ownership and education in CHIS 2003.

To address the missing values due to item non-response for other variables, the UCLA Center for Health Policy Research staff imputed nearly all the missing values through hierarchical sequential hotdecking with donor replacement. This method rank orders the control variables from the most essential to the least essential. It then allows the control variables to be dropped if the imputation conditions (such as minimal number of donors or no missing values in control variables) are not met in the imputation process. The control variables are dropped one at a time or sequentially, starting from the least essential. The imputation flags for CHIS source variables are included in a separate data file. CHIS incorporates an automated data quality control check both before and after the imputation process.

2.7 Methodology Report Series

A series of five methodology reports are available with detailed descriptions about the methods used in CHIS 2003:

- Report 1 - Sample Design
- Report 2 - Data Collection Methods
- Report 3 - Data Processing Procedures
- Report 4 - Response Rates
- Report 5 - Weighting and Variance Estimation

For further information on CHIS data and the methods used in the survey, visit the California Health Interview Survey Web site at www.CHIS.ucla.edu or contact CHIS at CHIS@ucla.edu.

3. How to Use the Data Dictionary

The Data Dictionary describes the variables in the CHIS 2003 Adult Survey Public Use File. The index of the data dictionary includes two variable lists: 1) the variables sorted alphabetically by variable name; and 2) the variables arranged in the order of the adult survey questionnaire version 11.0. The table of contents lists the topic areas in the order they are found in the questionnaire. Please note that identical variable names appearing in the CHIS 2001 and CHIS 2003 data files is not a guarantee of identical question wording or universe; please consult the questionnaires and data dictionaries to assess comparability. A printable version of the adult questionnaire can be found on the California Health Interview Survey web site at www.CHIS.ucla.edu.

The data dictionary contains the following fields:

- **Variable (VARIABLE).** This field stores the names of the variables in the Public Use File. Generally, the first letter of the variable name corresponds to the letter assigned to the topic section in which the variable or question can be found. Variable names beginning with “ISR” or ending with “_X” are imputation flags.**
- **Questionnaire Item (QNAME03).** This field stores the names of the 2003 survey items in the Public Use File. A blank field in Questionnaire Item means the variable is derived (constructed) from survey items.
- **Questionnaire Item in 2001 (QNAME01).** This field stores the names of 2001 survey items that are identical to 2003 survey items in the Public Use File.
- **Questionnaire Location (QPAGENUM).** This field in the dictionary represents the location of the variable in the CHIS 2003 Adult Questionnaire.
- **Description (LABEL).** This field provides a unique description (or label) of the variable. The descriptions are often shortened versions of the corresponding questions in the questionnaire.
- **Value (VALUE).** This field lists the response categories or levels (values) of the variable. Both the numeric values and the corresponding descriptive labels are provided.
- **Universe (UNIVERSE).** The universe of a variable indicates which respondents are eligible for the corresponding question. The default for the CHIS 2003 Adult Survey Public Use File is all respondents, ages 18 and over. For some variables (or questions), certain respondents become ineligible due to skip patterns or other restrictions (e.g., age and sex). In addition, the universe field in the dictionary provides information on how certain variables were constructed.

** The imputation flags for CHIS source variables are contained in a separate data file. The imputation flags indicate the missing values (don't know, refused, not ascertained) that have been imputed for each record.

4. Data Dictionary Variable Listings

A. Alphabetical Listings by Variable Name

ALPHABETICAL LISTINGS BY VARIABLE NAME		
VARIABLE NAME	DESCRIPTION	PAGE NUMBER
AA5C	ENROLLED MEMBER IN RECOGNIZED TRIBE	DD-9
AB1	GENERAL HEALTH CONDITION	DD-15
AB17	DOCTOR EVER TOLD HAVE ASTHMA	DD-15
AB18	TAKING DAILY MEDICATION TO CONTROL ASTHMA	DD-19
AB19	FREQUENCY OF ASTHMA SYMPTOMS IN PAST 12 MOS: CURRENT ASTHMA	DD-18
AB22	DOCTOR EVER TOLD HAVE DIABETES	DD-25
AB23_P	AGE WHEN DIABETES DIAGNOSED (PUF RECODE)	DD-25
AB24	CURRENTLY TAKING INSULIN	DD-26
AB25	CURRENTLY TAKING DIABETIC PILLS TO LOWER BLOOD SUGAR	DD-27
AB29	DOCTOR EVER TOLD HAVE HIGH BLOOD PRESSURE	DD-28
AB30	CURRENTLY TAKING MEDICATIONS TO CONTROL HIGH BLOOD PRESSURE	DD-28
AB34	DOCTOR EVER TOLD HAVE ANY KIND OF HEART DISEASE	DD-29
AB39_P	AGE TOLD ABOUT ASTHMA (PUF RECODE)	DD-16
AB40	STILL HAS ASTHMA	DD-16
AB41	ASTHMA EPISODE/ATTACK IN PAST 12 MOS	DD-17
AB42	WORKDAYS MISSED DUE TO ASTHMA IN PAST 12 MOS	DD-20
AB43	HEALTH PROFESSIONAL EVER GAVE ASTHMA MANAGEMENT PLAN	DD-20
AB44	WHEEZING OR WHISTLING IN CHEST IN PAST 12 MOS	DD-21
AB44A	MENTIONED BRONCHITIS, EMPHYSEMA OR COPD	DD-21
AB45	# OF WHEEZING OR WHISTLING IN PAST 12 MOS	DD-22
AB46	# OF TIMES MEDICAL HELP SOUGHT FOR BREATHING PROB PAST 12 MOS	DD-22
AB47	# OF WORKDAYS LOST DUE TO BREATHING PROBLEM IN PAST 12 MOS	DD-23
AB48	ALLOW DOGS INSIDE HOME	DD-23
AB49	ALLOW CATS INSIDE HOME	DD-24
AB50	SEEN COCKROACHES INSIDE HOME IN PAST 12 MOS	DD-24
AB51	TYPE I OR TYPE II DIABETES	DD-26
AB52	DOCTOR EVER TOLD HAVE HEART FAILURE/CONGESTIVE HEART FAILURE	DD-29
AB53	DOCTOR EVER TOLD HAVE SEIZURE DISORDER OR EPILEPSY	DD-30
AB54	CURRENTLY TAKE MEDICINE TO CONTROL SEIZURE DISORDER/EPILEPSY	DD-30
AB56	EXTENT EPILEPSY INTERFERED WITH NORMAL ACTIVITY IN PAST MONTH	DD-31
AB57	KIND OF PLACE GOT LAST FLU SHOT	DD-32
AB58	MAIN REASON NOT GET FLU SHOT IN PAST 12 MOS	DD-32
AB59	EVER HAD PNEUMONIA SHOT	DD-33
AB60	HOW FIRST FOUND BREAST CANCER	DD-37
AB61	TYPE OF MOST RECENT RECTAL EXAM	DD-40

AC6	DOCTOR EVER TOLD HAD A STROKE	DD-45
AC7	FALLEN TO GROUND MORE THAN ONCE IN PAST 12 MOS	DD-46
AC8	INCONTINENT IN PAST 30 DAYS	DD-46
