## Family Cancer History Introduction

The CHIS 2005 Family Cancer History Supplement is a separate data file containing information about the selected adult respondent's family history of cancer. The data were obtained from the CHIS 2005 adult interview.

The Family Cancer History Supplement provides detailed history about several specific cancer types among various first- and second-degree blood relatives. Only sampled adults under 65 years of age were asked about their family's history of cancer. This questionnaire module first asked if any first degree (mother, father, sisters, brothers, sons or daughters) or second degree relatives (aunts, uncles, grandparents) were ever diagnosed with cancer. If so, additional questions were asked to determine if any of these relatives were diagnosed with breast, ovarian, uterine, prostate, colon, or rectal cancer. If so, additional questions were then asked to identify the specific relationship to the adult respondent and the age when the relative was first diagnosed with cancer. The supplemental data file includes 333 cancer history variables and 16 constructed variables. The constructed variables summarize some of the detailed family history of cancer variables and are also available in the CHIS 2005 Adult Public Use File (PUF).

Data users who wish to link the Family Cancer History Supplement data file to the Adult PUF may use the variable "PUF\_ID" to merge the files. This will allow the use of sample weights and other relevant variables of interest. Unlike the variables in the main data file, imputation was not carried out for the family cancer history variables.

The CHIS 2005 family cancer history questions and constructs were created in collaboration with the National Cancer Institute (NCI).

Please note that cancer related information about the adult respondent, including cancer screening and diagnosis, is contained in the 2005 Adult PUF.
