TABLE OF CONTENTS

1. Introduction

1.1 CHIS 2005 Teen Survey Data File

The 2005 California Health Interview Survey (CHIS 2005) Teen Data File consists of individual records from the Teen component of CHIS 2005.

The UCLA-Center for Health Policy Research (UCLA-CHPR) is responsible for maintaining consistent standards to protect respondent confidentiality as specified in approved protocols by the UCLA IRB (09-05-103-02) and the California Committee for the Protection of Human Subjects (00-04-04). Organizations that receive CHIS data are required to complete a data sharing agreement with UCLA-CHPR. The data files listed below must be maintained in accordance with the provisions of the data sharing agreement between the California Department of Public Health (CDPH) and UCLA-CHPR. In order to protect respondent confidentiality, UCLA-CHPR maintains the most confidential and sensitive CHIS data only in its files at the Data Access Center located at UCLA-CHPR. If researchers would like access to the latitude and longitude data in the CHIS 2005 data file by special request, or require access to other highly sensitive variables, please contact dacchpr@ucla.edu. Limited technical assistance is also available from CHIS – please send email to chis@ucla.edu

1.2 Accompanying Files

The following describes multiple files included in the package along with the data file. Some are not necessary for data analysis but add convenience in utilizing the main data.

a. Data file: teen.sas7bdat, teen.sav, teen.dta
b. Proc format file: TEEN_PROC_FORMAT.SAS
c. Format file: TEEN_FORMAT.SAS
d. Label file: TEEN_LABEL.SAS
For sample codes using Proc format, format and label files, see Section 4.
e. Imputation flag file: teenf.sas7bdat, teenf.sav, teenf.dta
See Section 2.6 for descriptions of imputation flag variables and values.
f. Others: TEEN.XPT, TEENF.XPT

2. CHIS 2005 Design and Methodology Summary

2.1 Overview

The California Health Interview Survey (CHIS) is a population-based telephone survey of California's population conducted every other year since 2001. CHIS is the largest health survey conducted in any state and one of the largest health surveys in the nation. CHIS is conducted by the UCLA Center for Health Policy Research (UCLA-CHPR) in collaboration with the California Department of Public Health, the Department of Health Care Services, California Department of Mental Health, First 5 California, The California Endowment, the National Cancer Institute, and

Kaiser Permanente. CHIS collects extensive information for all age groups on health status, health conditions, health-related behaviors, health insurance coverage, access to health care services, and other health and health related issues. Within each household, separate interviews are conducted with a randomly selected adult (age 18 and over), adolescents (ages 12-17), and parents of children (ages 0 to 11). CHIS 2005 is the third CHIS data collection cycle and was conducted between July 2005 and April 2006.

CHIS data and results are used extensively by federal and State agencies, local public health agencies and organizations, advocacy and community organizations, other local agencies, hospitals, community clinics, health plans, foundations, and researchers. The data are used for analyses and publications to assess public health and health care needs, to develop and advocate policies to meet those needs, and to plan and budget health care coverage and services. Many researchers throughout California and the nation use CHIS data files to further their understanding of a wide range of health-related issues (for many examples of these studies, visit the CHIS Research Clearinghouse: http://www.chis.ucla.edu/rc).

2.2 Sample Design Objectives

The CHIS sample is designed to meet two objectives: (1) provide estimates for most counties and groups of counties with small populations; and (2) provide estimates for California's overall population, major racial and ethnic groups, and for several smaller ethnic subgroups as well. To achieve these objectives, CHIS employed a multi-stage sample design. First, the state was divided into 44 geographic sampling strata, 41 single-county strata and 3 multi-county strata comprised of the 17 remaining counties. Second, within each geographic stratum, households were selected through random-digit dial (RDD), and within each household, one adult (age 18 and over) respondent was randomly selected. In addition, in those households with adolescents (ages 12-17) and/or children (under age 12), one adolescent was randomly selected for interview and one child was selected; the most knowledgeable adult about the child's health completed the child interview.

Table 1-1 shows the 44 sampling strata for CHIS 2005. A sufficient number of adult interviews were allocated to each stratum to support the first sample design objective. These strata were revised from those used in previous CHIS cycles, increasing the number of individual counties from 33 to 41.

Table 1-1. California County and County-Group Strata in CHIS 2005 Sample Design

1. Los Angeles	16. Sonoma	31. Napa
2. San Diego	17. Stanislaus	32. Kings
3. Orange	18. Santa Barbara	33. Madera
4. Santa Clara	19. Solano	34. Monterey
5. San Bernardino	20. Tulare	35. Humboldt
6. Riverside	21. Santa Cruz	36. Nevada
7. Alameda	22. Marin	37. Mendocino
8. Sacramento	23. San Luis Obispo	38. Sutter
9. Contra Costa	24. Placer	39. Yuba
10. Fresno	25. Merced	40. Lake
11. San Francisco	26. Butte	41. San Benito
12. Ventura	27. Shasta	42. Colusa, Glen, Tehama
13. San Mateo	28. Yolo	43. Plumas, Sierra, Siskiyou, Lassen, Modoc, Trinity, Del Norte
14. Kern	29. El Dorado	
15. San Joaquin	30. Imperial	44. Mariposa, Mono, Tuolumne, Alpine, Amador, Calaveras, Inyo

Source: UCLA Center for Health Policy Research, 2005 California Health Interview Survey.

The samples in Marin, Humboldt, and Solano Counties were enhanced with additional funding. Additional samples were also selected statewide and in San Diego County to increase the number of child interviews; telephone numbers selected in these two additional samples were screened to identify households with children ages 0 to 11. All supplemental samples were implemented with and incorporated into the original statewide RDD sample.

The main RDD CHIS sample size is sufficient to accomplish the second objective. To increase the precision of estimates for Koreans and Vietnamese, areas with relatively high concentrations of these groups were sampled at higher rates; these geographically targeted oversamples were supplemented by phone numbers for group-specific surnames drawn from listed telephone directories to further increase the sample size for Koreans and Vietnamese.

2.3 Data Collection

To capture the rich diversity of the California population, interviews were conducted in five languages: English, Spanish, Chinese (Mandarin and Cantonese dialects), Vietnamese, and Korean. These languages were chosen based on analysis of 2000 Census data to identify the languages that would cover the largest number of Californians in the CHIS sample that either did not speak English or did not speak English well enough to participate otherwise.

Westat, a private firm that specializes in statistical research and large-scale sample surveys, conducted the CHIS 2005 data collection. Westat staff interviewed one randomly selected adult in each sampled household and adolescents and children if present in the household and associated with the sampled adult. Up to three interviews could have been completed in each sampled household. In households with children where the sampled adult was not the screener respondent, children and adolescents could be sampled as part of the screening interview, and the extended child (and adolescent) interviews could be completed before the adult interview. This "child-first" procedure was new for CHIS 2005 and substantially increased the yield of child interviews. While numerous subsequent attempts were made to complete the adult interview, there were 2,629 completed child and/or adolescent interviews in households for which an adult interview was not completed. Table 1-2 shows the number of completed adult, child, and adolescent interviews in CHIS 2005, by the type of sample (RDD or supplemental sample).

Proxy interviews were allowed for frail and ill persons over the age of 65. For 139 elderly adults, either the spouse/partner or adult child of these elderly adults completed a proxy interview. Only a subset of questions identified as appropriate for a proxy respondent were administered.

Prior to the interview contact, telephone numbers for which addresses could be found were mailed advance letters to inform household members about the survey. For the first time, CHIS 2005 advance letters included a $2 bill as prepaid monetary incentives.

Table 1-2. Number of Completed CHIS 2005 Interviews by Type of Sample Instrument

Type of sample	Adult	Child	Adolescent
RDD			
Base plus county supplements	41,074	9,605	3,739
Statewide child supplement	525	511	84
San Diego child supplement	1,143	1,160	186
Supplemental samples:			
Korean	199	60	14
Vietnamese	79	22	6
Total RDD + supplemental cases	43,020	11,358	4,029

Source: UCLA Center for Health Policy Research, 2005 California Health Interview Survey.

Interviews in all languages were administered using Westat's computer-assisted telephone interviewing (CATI) system. The average adult interview took 35 minutes to complete. The average child and adolescent interviews took 15 minutes and 20 minutes, respectively. For "child-first" interviews, additional household information asked as part of the child interview averaged

almost 8 minutes. Interviews in the non-English languages generally took longer to complete. Just over 10 percent of the adult interviews were completed in a language other than English, as were 18 percent of all child (parent proxy) interviews and 7 percent of all adolescent interviews.

2.4 Response Rates

The overall response rate for CHIS 2005 is a composite of the screener completion rate (i.e., success in introducing the survey to a household and randomly selecting an adult to be interviewed), and the extended interview completion rate (i.e., success in getting one or more selected persons to complete the extended interview).

The CHIS response rates were calculated using the American Association for Public Opinion Research (AAPOR) methods. The CHIS 2005 screener completion rate was 49.8 percent, and the rate was higher for those households that could be sent the advance letter. The extended interview completion rate varied across the adult, child and adolescent interviews. Multiplying the screener and extended rates gives an overall response rate for each type of interview. We calculate the percentage of households completing one or more of the extended interviews (adult, child, and/or adolescent) at the household level. It is a useful summary of the overall success of the study. The 2005 survey is the first time that a household response rate has been reported because in earlier cycles the adult interview had to be completed before the child or the adolescent interview (i.e., the household rate equaled the adult rate). For CHIS 2005, the household response rate was 29.5 percent (the product of the screener response rate and the completion rate at the household level of 59.3 percent). The adult extended completion rate for 2005 was 54.0 percent, resulting in an overall adult response rate of 26.9 percent for adults. All of the household and person level response rates vary by sampling stratum.

The CHIS response rate is comparable to response rates of other scientific telephone surveys in California, such as the 2005 California Behavioral Risk Factor Surveillance System (BRFSS) survey with an overall response rate of 29.2 percent. California as a whole and the state's urban areas in particular are among the most difficult parts of the nation in which to conduct telephone interviews. Survey response rates tend to be lower in California than nationally, and over the past decade response rates have been declining both nationally and in California.

2.5 Weighting the Sample

To produce population estimates using the CHIS data, weights must be applied to the sample data to represent the non-institutionalized population of California and compensate for a variety of factors, some directly resulting from the design and administration of the survey. The weighting procedure used for CHIS 2005 accomplishes the following objectives:

- Compensate for differential probabilities of selection for households and persons;
- Reduce biases occurring because nonrespondents may have different characteristics than respondents;
- Adjust, to the extent possible, for undercoverage in the sampling frames and in the conduct of the survey; and
- Reduce the variance of the estimates by using auxiliary information.

Sample codes for applying weights and design information in analyses for different software packages are given in Section 4.

2.6 Imputation Methods

There are two imputation procedures used by Westat to fill in missing responses for items in CHIS 2005 that are essential for weighting the data. The first imputation technique was a completely random selection from the observed distribution of respondents. This method was used only for a few data items when the percentage of the items missing was very small. For example, when imputing the missing values for self-reported age which had a very low item non-response rate, the distributions of the responses for age by type of interview (adult, child, or adolescent) were used to randomly assign an age using probabilities associated with these distributions.

The second technique is hot deck imputation without replacement. The hot deck approach is probably the most commonly used method for assigning values for missing responses in large-scale household surveys. With a hot deck, a value reported by a respondent for a particular item is assigned or donated to a "similar" person who did not respond to that item. The characteristics defining "similar" vary for different variables. To carry out hot deck imputation, the respondents to an item form a pool of donors, while the nonrespondents are a group of recipients. A recipient is matched to the subset pool of donors based on household and individual characteristics. A value for the recipient is then randomly imputed from one of the donors in the pool. Once a donor is used, it is removed from the pool of donors for that variable. Hot deck imputation was used to impute the same items in CHIS 2003 and CHIS 2005; that is race, ethnicity, home ownership, and education.

The UCLA Center for Health Policy Research imputed missing values for nearly every variable in the data files other than those handled by Westat and some sensitive variables in which nonresponse had its own meaning. Overall, item nonresponse rates in CHIS 2005 were modest, with most variables missing valid responses for less than 2% of the sample. However, there were a few exceptions where item nonresponse rate was greater than 20%, such as household income.

The imputation process conducted by UCLA started with data editing, sometimes referred to as logical or relational imputation: for any missing value, a valid replacement value was sought based on known values of other variables of the same respondent or other sample(s) from the same household. For the remaining missing values, hierarchical sequential hot-deck imputation with donor replacement was used. This method replaces a missing value for one respondent using a valid response from another respondent with similar characteristics as defined by a set of control variables. The control variables were ranked in order from the most to the least important. This procedure allowed control variables to be dropped if certain conditions (such as the minimal number of donors) were not met. The control variables were dropped sequentially, starting from the variable ranked least important. Once a responding case was used as a donor, it was dropped from the donor pool preventing using one donor multiple times.

Control variables always included the following: gender, age group, race/ethnicity, poverty level (based on household income), educational attainment (more detailed than Westat impute educational attainment), and region. Other control variables were also used depending on the nature of the imputed variables. Among the control variables, gender, age, race/ethnicity and regions were imputed by Westat. Household income and educational attainment were imputed first in order to

impute other variables. Household income, for example, was imputed using the hot-deck method within ranges from a set of auxiliary variables such as income range and/or poverty level.

The imputation order of the other variables followed the questionnaire. After all imputation was done, logical checks and edits were performed once again to ensure consistency between the imputed and non-imputed values on a case-by-case basis.

In addition to the main data file, a data file including variables flagging the imputation status of all variables subject to imputation provided. CHIS data users who wish to exclude imputed values may apply the imputation flags to the main data. This is done by merging the main data file with the imputation flag file.

Imputation flag variables starting with **I** followed by variable names are flags for weighting variables (e.g., **ISRAGE**). The remainder of imputation flag variables begin with variable names and end with **X** (e.g., **AB1_X**). For both types of imputation flag variables, the value of **"-10"** in the imputation flag file indicates that there was no imputation done on the corresponding variable for that respondent. For the weighting variable imputation flags, **"-9"** indicates that the value in the data file was imputed but does not provide the original value. The values in the imputation flags for non-weighting variables (other than **"-10"** indicating no imputation) represent the original responses. In most cases, the values of the original responses are: Don't Know (**-8**), Refused (**-7**), or Not Ascertained (**-9**). In a few cases, the values of the original responses have been edited; the imputation flag file contains the original positive value.

Methodology Report Series

A series of five methodology reports are available with more detail about the methods used in CHIS 2005:

- Report 1 – Sample Design;
- Report 2 – Data Collection Methods;
- Report 3 – Data Processing Procedures;
- Report 4 – Response Rates; and
- Report 5 – Weighting and Variance Estimation.

For further information on CHIS data and the methods used in the survey, visit the California Health Interview Survey Web site at http://www.chis.ucla.edu/methods.html.

3. How to Use the Data Dictionary

This Data Dictionary describes the variables in the CHIS 2005 Adolescent PUF. The index of the data dictionary lists variables by the alphabetical order and by the order in the adolescent survey questionnaire. Please note that identical variable names appearing in the CHIS 2001, CHIS 2003 and CHIS 2005 data files does not guarantee identical question wording, response categories or universe; please consult the questionnaires and data dictionaries to assess comparability across cycles. A printable version of the adolescent questionnaire can be found on the CHIS web site at http://www.chis.ucla.edu/topics.html.

The data dictionary contains the following fields:

- **VARNAME:** The names of the variables.

- **QNAME05:** The names of the 2005 survey items. A blank field means the variable is constructed with survey items shown in the **INPUT VAR** field.

- **QPAGENUM:** Location of the question in the CHIS 2005 questionnaire.

- **QNAME03:** The names of 2003 survey items identical or similar to the 2005 items.

- **QNAME01:** The names of 2001 survey items identical or similar to the 2005 items.

- **LABEL:** A description (or label) of the variable which is the same as what is included in the label file described in Section 1.2.

- **VALUE:** Response categories and their sample distributions of categorical variables. The following negative values are used for all variables:

-1: INAPPLICABLE.
-2: PROXY SKIPPED.
-5: ADULT/HOUSEHOLD INFORMATION NOT COLLECTED FOR TEEN AND CHILD INTERVIEWS.
-7: REFUSED.
-8: DON'T KNOW.
-9: NOT ASCERTAINED.

- **MEAN STATISTICS:** Sample distributions of continuous variables.

- **UNIVERSE:** The scope of eligible respondents for the corresponding item. For some questions and variables, certain respondents become ineligible due to skip patterns or other restrictions (e.g., age and sex).

- **INPUT VAR:** Source variables used to construct the one in the **VARNAME** field.

- **NOTES:** Additional information about the variable.

4. Sample Code Using Sample Design Information

The California Health Interview Survey (CHIS) employs a two-stage geographically stratified random digit-dial (RDD) sample design. This complex design requires proper weighting and variance (or its square root– standard error) calculation of the estimates. Most statistical software packages calculate variance assuming that the data are from a simple random sample; this underestimates the variance of estimates produced from the CHIS complex sample design. In order to accurately estimate variance without jeopardizing data confidentiality and respondent privacy, CHIS Public Use Files (PUFs) provide 80 replicate weights (rakedw1, …,rakedw80) in addition to the final weight (rakedw0).

These weights fulfill different functions. The final weight (rakedw0) accounts for the sample selection probabilities and statistical adjustments for potential undercoverage and nonresponse biases. When this weight is applied, it ensures that estimates from the CHIS sample are an unbiased representation of the California population. The replicate weights (rakedw1, …, rakedw80) are specially designed for valid variance estimation in the absence of the geographical sample design information (excluded from the CHIS PUFs). These 80 different weights provide variance estimates computed with 80 replications.

When using replicate weights in conjunction with the final weight, the estimates and their variance estimation are unbiased. When analyzing data from the CHIS PUFs, if the final weight is applied without the replicate weights unbiased estimates will be produced, but their variability will be underestimated due to the incorrect assumption that the sample is a simple random sample.

This document illustrates how the CHIS PUFs can be analyzed to produce valid variance estimates using SAS/STAT 9.2 or higher, SUDAAN, and Stata V.9 or higher. (Note SAS/STAT 9.2 is a new version that was released in 2009.) These are three main software packages capable of incorporating replicate weights. The main difference in operating these software packages is that the sample design information is specified within each procedure for SAS/STAT and SUDAAN, whereas Stata requires sample design specification in a separate step preceding the analyses.

For SAS users, the following code can be used to apply `PROC FORMAT`, `FORMAT` and `LABEL` files described in Section 1.2.

SAS:

```
LIBNAME libraryname "folder location";
%INC "folder location/PROCFORMATfilename.sas";

DATA data;
SET libraryname.datafilename;
%INC "folder location/FORMATfilename.sas";[a]
%INC "folder location/LABELfilename.sas";
RUN;
```

[a] Unless the `PROCFORMAT` file is commanded beforehand, the `FORMAT` file will not function properly.

This section illustrates sample codes for a number of different types of analyses: for continuous variables, we present calculation of means and linear regression analysis; and for categorical

variables, we demonstrate calculation of frequencies and logistic regression analysis. Sample codes for all four software packages are provided for each analysis. Throughout all analyses, we find that the estimates and their standard errors are identical across all software packages examined in this document.

For illustration purposes, Body Mass Index (bmi_p) is presented as a continuous dependent variable and current asthma status (astcur) as a categorical dependent variable. These variables are examined in relation to race (racehpr2), sex (srsex) and age (srage_p). CHIS data users who wish to replicate the analysis presented here may copy the sample codes and generate the same results.

4.1 Mean Calculation

In the sample code that follows, the distribution of BMI (bmi_p) is examined by race (racehpr2) and by the interaction between race and sex (racehpr2*srsex).

SAS:

```
PROC SORT DATA = data;
BY racehpr2 srsex;
RUN;
PROC SURVEYMEANS DATA = data VARMETHOD=JACKKNIFE;
WEIGHT rakedw0;
REPWEIGHT rakedw1--rakedw80;
VAR bmi_p;
BY racehpr2 srsex; [a]
RUN;
```

[a] This produces just racehpr2*srsex grouping.

SUDAAN:

```
PROC DESCRIPT DATA = data FILETYPE = SAS DESIGN = JACKKNIFE;
WEIGHT rakedw0;
JACKWGTS rakedw1--rakedw80/adjjack=1;
VAR bmi_p;
TABLES racehpr2 racehpr2*srsex;
SUBGROUP racehpr2 srsex;
LEVELS 7 2;
RUN;
```

Stata:

Sample design specification step [a]

```
use "DATASET LOCATION"
svyset [pw=rakedw0], jkrw(rakedw1-rakedw80, multiplier(1)) vce(jack) mse
```

Analysis

```
svy: mean bmi_p, over(racehpr2)
svy: mean bmi_p, over(srsex racehpr2)
```

[a.] **Sample design specification step** should be included before any analysis in SPSS and Stata.

4.2 Frequency Calculation

In the following sample code, the percentage of people who have asthma currently (astcur) is examined by race (racehpr2) and by the interaction between race and sex (racehpr2*srsex).

SAS:

```
PROC SORT DATA = data;
BY racehpr2 srsex;
RUN;
PROC SURVEYMEANS DATA = data VARMETHOD=JACKKNIFE;
WEIGHT rakedw0;
REPWEIGHT rakedw1--rakedw80;
VAR astcur;
CLASS astcur;
BY racehpr2 srsex; [a]
RUN;
```

Alternatively, PROC SURVEYFREQ may be useful especially for the variables with more than two categories. One caveat in creating multiple tables in one PROC SURVEYFREQ procedure is that the procedure takes the smallest applicable sample sizes among all variables. We recommend creating one table per one PROC SURVEYFREQ procedure as follows:

```
PROC SURVEYFREQ DATA = data VARMETHOD=JACKKNIFE;;
WEIGHT rakedw0;
REPWEIGHT rakedw1--rakedw80;
TABLE racehpr2*astcur /row;
RUN;
PROC SURVEYFREQ DATA = data VARMETHOD=JACKKNIFE;;
WEIGHT rakedw0;
REPWEIGHT rakedw1--rakedw80;
TABLE srsex*racehpr2*astcur/row;
RUN;
```

[a] This produces just racehpr2*srsex grouping.

SUDAAN:

```
PROC CROSSTAB DATA = data FILETYPE = SAS DESIGN = JACKKNIFE;
WEIGHT rakedw0;
JACKWGTS rakedw1--rakedw80/adjjack=1;
TABLES astcur*racehpr2 racehpr2*astcur*srsex;
SUBGROUP astcur racehpr2 srsex;
LEVELS 2 7 2;
RUN;
```

Stata:

```
svy: tabulate astcur racehpr2, col se ci

gen racesex=1 if racehpr2 ==1 & srsex ==1 [a]
replace racesex=2 if racehpr2 ==1 & srsex ==2
```

```
replace racesex=3 if racehpr2 ==2 & srsex ==1
replace racesex=4 if racehpr2 ==2 & srsex ==2
replace racesex=5 if racehpr2 ==3 & srsex ==1
replace racesex=6 if racehpr2 ==3 & srsex ==2
replace racesex=7 if racehpr2 ==4 & srsex ==1
replace racesex=8 if racehpr2 ==4 & srsex ==2
replace racesex=9 if racehpr2 ==5 & srsex ==1
replace racesex=10 if racehpr2 ==5 & srsex ==2
replace racesex=11 if racehpr2 ==6 & srsex ==1
replace racesex=12 if racehpr2 ==6 & srsex ==2
replace racesex=13 if racehpr2 ==7 & srsex ==1
replace racesex=14 if racehpr2 ==7 & srsex ==2
label variable racesex "Race x Sex"
label define racesexf 1 "latin male" 2 "latin fem" 3 "pi male" 4 "pi fem" 5 "na
male" 6 "na female" 7 "asian mal" 8 "asian fem" 9 "aa male" 10 "aa fem" 11
"white mal" 12 "white fem" 13 "others mal" 14 "others fem"
label values racesex racesexf

svy: tabulate astcur racesex, col se ci
```

[a] **Generating a new variable is recommended, as Stata creates overlapping categories when crossing variables.**

4.3 Linear Regression

The following example examines Body Mass Index (`bmi`) in relation to sex (`srsex`) and age (`srage_p`) while controlling for each other. Note `srsex` is a categorical variable; and Male (`srsex`=1) are used as their reference categories.

SAS:

```
DATA newdata;SET data;
IF SRSEX=1 THEN FEMALE=0;ELSE FEMALE=1;[a]
RUN;

PROC SURVEYREG DATA = newdata VARMETHOD=JACKKNIFE;
WEIGHT RAKEDW0;
REPWEIGHT RAKEDW1--RAKEDW80;
MODEL BMI_P = FEMALE SRAGE_P;
RUN;
```

[a] For categorical variable, we need to create indicator variable for each cateogory except the reference category.

SUDAAN:

```
PROC REGRESS DATA = data FILETYPE = SAS DESIGN = JACKKNIFE;
WEIGHT rakedw0;
JACKWGTS rakedw1--rakedw80/adjjack=1;
SUBGROUP srsex;
LEVELS 2;
REFLEVEL srsex=1;
MODEL bmi_p = srsex srage_p;
RUN;
```

Stata:

```
xi: svy:  regress bmi_p i.srsex srage_p
```

4.4 Logistic Regression

The following sample programming code examines current asthma status (astcur) among adults in California, controlling for race (racehpr2), sex (srsex), and age (srage_p). As SUDAAN and Stata require the dependent variables coded as 0 and 1 for logistic regression, we create a new dependent variable ast and assign 1 where astcur=1 ("Current asthma") and 0 where astcur=2 ("No current asthma"). The category, "No current asthma," is used as the reference in the analysis.

SAS:

```
PROC SURVEYLOGISTIC DATA = data VARMETHOD=JACKKNIFE;
FORMAT astcur astcurf. racehpr2 racehprf. srsex srsex.;
WEIGHT rakedw0;
REPWEIGHT rakedw1--rakedw80;
CLASS astcur (REF="NO CURRENT ASTHMA");CLASS racehpr2(REF="WHITE")
srsex(REF="MALE")/PARAM = REF;
MODEL astcur = racehpr2 srsex srage;
RUN;
```

[a.] When the values are formatted either in the data step or in the procedure, SAS automatically picks the category of the categorical variables whose label is in the last alphabetical order as a reference group. In PROC SURVEYLOGISTIC, the reference category of the independent and dependent variables may be specified in a CLASS statement.

SUDAAN:

```
DATA newdata;
SET data;
IF astcur=1 THEN ast=1;
 ELSE IF astcur=2 THEN ast=0;
RUN;

PROC RLOGIST data = newdata FILETYPE = SAS DESIGN = JACKKNIFE;
WEIGHT rakedw0;
JACKWGTS rakedw1--rakedw80/adjjack=1;
SUBGROUP racehpr2 srsex;
LEVELS 7 2;
REFLEVEL racehpr2 = 6 srsex = 1;
MODEL ast = racehpr2 srsex srage_p;
RUN;
```

Stata:

```
recode astcur (2=0) (1=1) (-9=.), gen (ast)

xi: svy: logit ast srage_p i.race i.srsex [a]
xi: svy: logistic ast srage_p i.race i.srsex [b]
```

[a.] This statement produces parameter estimates.
[b.] This statement produces odds ratios.

Stata automatically chooses the lowest value of the categorical variable as the reference group for the independent and dependent variables.

5. Data Dictionary Variable Listings

A. Variable Name (alphabetical)

IHS	COVERED BY INDIAN HEALTH SERVICES	DD-98
INJCA	CAUSE OF INJURY	DD-26
INS	CURRENTLY INSURED	DD-99
INS12M	MOS COVERED BY HEALTH PLANS LAST 12 MOS	DD-99
INS64	TYPE OF CURRENT HEALTH COVERAGE SOURCE - UNDER 65	DD-100
INSANY	ANY INS IN LAST 12 MOS	DD-101
INSEM	COVERED BY EMPLOYER-BASED PLANS	DD-101
INSHF	COVERED BY HEALTHY FAMILIES	DD-102
INSMC	COVERED BY MEDICARE	DD-103

C. Restricted Variables

The following geographic variables are not located in the source files, but may be accessible upon request and IRB approval (UCLA & CHPS). These variables are restricted due to their identifiable nature.

VARIABLE	LABEL	NOTE
LATITUDE	LATITUDE	GEOGRAPHIC LONGITUDE OF RESIDENCE. USED FOR MAPPING.
LONGIT	LONGITUDE	GEOGRAPHIC LONGITUDE OF RESIDENCE. USED FOR MAPPING.
CBLK	CENSUS BLOCK INCLUDING CENSUS TRACT	SMALLEST CENSUS DELINEATION AVAILABLE TO MERGE WITH CENSUS DATA; USED FOR MULTILEVEL MODELING, NEIGHBORHOOD ANALYSIS.

Teen and child restricted variables

VARIABLE	LABEL	NOTE
SCH_BLK	SCHOOL CENSUS TRACT INCLUDING BLOCK	
SCH_CDS	STATE SCHOOL ID NUMBER	
SCH_LAT	SCHOOL LATITUDE	
SCH_LON	SCHOOL LONGITUDE
