

(Continued from page 3)

Currently, 256 community clinics provide dental services in California, utilizing 450 full-time equivalent dentists, and providing over one million dental encounters.<sup>7</sup> Previous data indicate that approximately 28% of dentists in private practice provide care for a substantial number of patients with public insurance (about 100 or more publicly insured patients per year). Furthermore, approximately 49% of private-practice dentists provide care at a sliding scale to accommodate the needs of low-income populations, although the extent of these discounts is not known.<sup>8</sup>

#### Authors

Nadereh Pourat, PhD, is associate professor at the UCLA School of Public Health and director of research planning at the UCLA Center for Health Policy Research.

Gina Nicholson, MPH, is a senior research associate at the UCLA Center for Health Policy Research.

#### Data and Methods

The California Dental Association (CDA) provided a list of all licensed dentists in California in 2008. This data included information on membership status, date of licensure and up to two practice addresses. Active status and specialty were only available for members of the CDA (70%). Oral surgery, oral pathology, oral radiology and public health specialists were not included. The population of each county was obtained from the California Department of Finance.<sup>9</sup> DHPSA designations were obtained from the U.S. Department of Health and Human Services.<sup>10</sup> Correctional facilities with a DHPSA designation were excluded from the total count. Data on community clinics were obtained from the State of California, Office of Statewide Health and Planning Department for 2007.<sup>11</sup> Only clinics reporting dentists on staff were included.

Active status was estimated for non-members as follows: those with a practice address were assumed to be active. Activity status was modeled for those without a practice address (2,282 or 7%) using characteristics of members without an office address. Data on dentists practicing in more than one location is limited to dentists who report any office addresses. The count of community clinics

providing dental care included only those utilizing dentists or hygienists. The number of dentists practicing in community clinics is reported as full-time equivalent, which may underestimate the actual number of individual dentists providing services in these clinics. The dentists working in community clinics would be a subset of licensed dentists in active practice.

The data in this fact sheet present a snapshot of licensed and actively practicing dentists in California in the third quarter of 2008. Changes in licensure, practice status and reported practice location of dentists continuously occur leading to discrepancies with data obtained in other time periods.

## Distribution and Characteristics of Dentists Licensed to Practice in California, 2008

Nadereh Pourat and Gina Nicholson

### Exhibit 1. Density of Actively Practicing Dentists in California Counties

California has about 14% of the total number of dentists nationwide—the largest percentage of any state.<sup>1</sup> Over 31,000 are licensed to practice in the state. Of these, an estimated 26,500 dentists actively practice in California (Exhibit 1). The remaining 4,500 are licensed but not actively practicing. These dentists primarily include those who are retired, disabled, employed in an unrelated occupation or continuing their education. The dentist-to-population ratio in California is estimated as 3.5 dentists per 5,000 or a dentist for every 1,440 persons. This ratio is higher than the national estimate of three dentists per 5,000 or a dentist for every 1,660 persons.<sup>2</sup>

Despite the large number of practicing dentists in California, many areas have a shortage of dentists. Alpine County, for example, has no actively practicing dentists. Yuba has a dentist-to-population ratio of less than one per 5,000. Imperial county falls below the ratio of 1.25 per 5,000, which may also be considered a shortage area if the population has unusually high needs or insufficient capacity for care among existing dentists. Other counties with a low supply of dentists include Colusa, Mariposa, Mono and San Benito at or below 1.5 per 5,000.

(Continued from page 1)

There are 233 dental health professional shortage areas (DHPSAs) statewide. These areas are where there is: a dentist-to-population ratio of one per 5,000 or lower; a high population need with a ratio of at least 1.25 dentists per 5,000 (or 1 per 4,000); and a public or non-profit health center that provides dental services to shortage areas or populations (154 of shortage designations are these health centers) (Exhibit 2).<sup>3,4</sup> DHPSAs are eligible for assignment of dentists through the National Health Service Corps as well as for scholarship and loan payment programs for dentists who agree to serve in shortage areas.

An estimated 84% of all licensed dentists are actively practicing. Nearly one-third of these dentists are female (Exhibit 2). The great majority of actively practicing dentists (84%) are in general practice.<sup>5</sup> Statewide, 14% of active dentists report practicing in more than one location, indicating further variations in capacity for care in a given geographic area.

The percentage of dentists who may be nearing retirement age is greater than the percentage of newly licensed dentists. Fifteen percent of active dentists have received their license within the past five years, while 19% have been licensed for 30 or more years. In some counties far fewer are newly licensed and many more are nearing retirement age. Among newly licensed dentists, 44% are female and 91% are generalists. Among those nearing retirement age, however, only 4% are female and 75% are generalists.

An estimated 12% of the California population is living at or below the federal poverty level. For this group, community clinics may be the primary source of dental care.<sup>6</sup>

(Continued on back)

## Notes:

All analyses of dentist characteristics are given only for the estimated number of dentists in active practice.

Gender was not available in 2008 licensure data. We used gender from the 2003 California Dental Survey for member dentists in both datasets. Gender was assigned for all other dentists based on first or middle name.

Data on dentists practicing in more than one location are calculated based on the number of dentists with multiple practices only among those dentists who list an office address. Data on primary care clinics are provided by the Office of Statewide Health Planning and Development (OSHPD) and are reported for 2007. Clinics with an affiliated dentist or hygienist (staff, contract, volunteer) were considered dental care clinics. Data on full-time equivalent (FTE) dentists are provided by OSHPD and are reported for 2007. The number of FTE dentists gives an estimate of the number of dentists working in primary care clinics. The count of dentists working in primary care clinics may overlap with the number of dentists in active practice.

Dental Health Professional Service Areas (DHPSAs) are areas designated as having too few dental providers and include geographic areas, population groups or medical facilities. Not all geographic areas apply for a DHPSA designation. Correctional facilities with a DHPSA designation were excluded from the total count.
