

Central/Southeast/Southwest Fresno

Health Profile

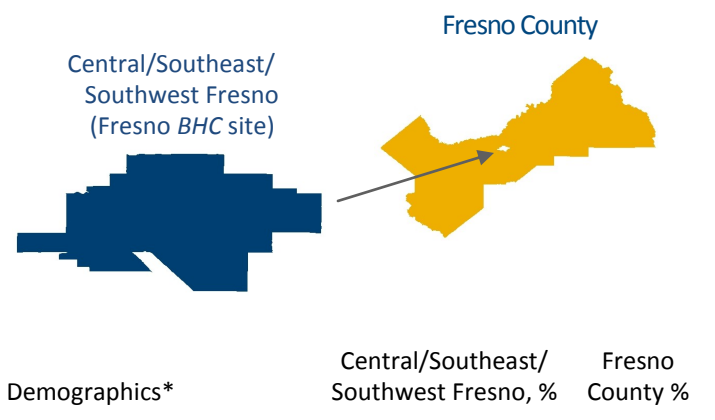

Understanding the health of your community can start with understanding the numbers. How many children have access to a safe park? How many adults have health insurance? To answer these questions, hundreds of residents in Central/Southeast/Southwest Fresno participated in the California Health Interview Survey (CHIS). The survey was conducted to support *Building Healthy Communities (BHC)*, a 10-year plan of The California Endowment (TCE) to help 14 communities develop into places where children are healthy, safe, and ready to learn.

This Health Profile describes the health of adults, teens, and children living in Central/Southeast/Southwest Fresno, one of the 14 *BHC* sites. It provides a snapshot of key survey findings prior to implementing the *BHC* plan and can be used to mobilize friends and neighbors, advocate for community change, secure greater resources, and guide community planning. To learn more about *BHC*, visit: www.calendow.org/healthycommunities/

Selected Highlights

- ◆ Adults in Central/Southeast/Southwest Fresno (Fresno *BHC* site) are more likely uninsured (37%) compared to adults in Fresno County (23%) and California (22%).
- ◆ Adults in Fresno *BHC* site are nearly twice as likely to be obese (39%) as adults in the state (21%).
- ◆ Parents of children under age 18 in Fresno *BHC* site are less likely to report that their neighbors get along, can be trusted, and are willing to help each other compared their statewide counterparts.
- ◆ Only half of children age 2-17 in Fresno *BHC* site reported having visited a dentist compared to over 85% of children in Fresno county and the California.
- ◆ Adults in the Fresno *BHC* site were three times less likely to go to the emergency department last year than their county and state counterparts.

Methods

The California Health Interview Survey (CHIS) is an ongoing comprehensive public health survey that provides health data for the state and counties in California. To gather meaningful health data for *Building Health Communities (BHC)*, The California Endowment supported a CHIS 2009 oversample in 14 *BHC* sites.

Households in each BHC site were randomly selected to participate through random digit dial (RDD) telephone sampling. Given the focus of BHC efforts on children and families, **adult eligibility included being a parent of a child under age 18 or an adult age 18 to 40. Children age 0 to 11 and teens age 12 to 17 were also eligible.** For children, interviews were administered with the adult most knowledgeable about that child; for teens, interviews were administered with the teen after obtaining parent's permission. County and state estimates come from CHIS 2009 and maintain the same eligibility criteria as the BHC site. Over 500 interviews were completed in each of the 14 *BHC* sites between April and September 2010. In Central/Southeast/Southwest Fresno, 331 interviews were conducted with eligible adults and 251 with children and teens.

Results provided in this health profile represent estimated values for the *eligible* population of the designated *BHC* site, its respective county and California. Estimates are based on the selected sample of the overall *eligible* population and thus have a degree of uncertainty. The data provided display 95% confidence intervals (CIs) indicating that we are 95% confident that the actual value of the health outcome lies between the lower and upper CI range. *Estimates with wide CIs should be interpreted with caution.*

References

- ¹ Households whose income falls below 200% of the federal poverty level are considered low income.
- ² Respondents who reported speaking a language other than English at home and speak English less than "very well" are considered to have limited English proficiency.
- ³ Body Mass Index (BMI) is a measure used to assess overweight and obesity. It is calculated by dividing weight in kilograms by height squared in meters. Adults with a BMI greater than or equal to 30 kg/m² are obese and a BMI greater than or equal to 25 kg/m² and less than 30 kg/m² are overweight. Teens with BMI-for-age and sex greater than or equal to the 85th percentile are considered overweight and obese.
- ⁴ Serious Psychological Distress (SPD) is often used as a proxy measure for serious mental illness in a population. Adult respondents were asked 6 questions, known as the "Kessler 6", to assess symptoms of distress during a 30-day period in the last year.
- ⁵ Males are considered binge drinkers if they consumed 5 or more alcoholic drinks on at least one occasion in the last year and females were considered binge drinkers if they consumed 4 or more alcoholic drinks on at least one occasion in the last year.
- ⁶ Regular physical activity for adults is defined as those who reported at least 30 minutes of moderate activity (excluding walking) for 5 or more days in the last week or those who reported at least 20 minutes of vigorous activity for 3 or more days in the last week.
- ⁷ Fruit and vegetable consumption does not include fruit juices or fried potatoes. Measures may not be comparable to previous CHIS questionnaires.
- ⁸ Physical activity among children and teens who attended school last week, excluding physical education (PE).
