## 1. About the CHIS 2001 Adolescent Survey Public Use File

The CHIS 2001 Adolescent Survey Public Use File (Adolescent PUF hereafter) is a data file consisting of individual records from the adult component of the 2001 California Health Interview Survey. It is a free product provided by the CHIS project to researchers and data analysts for use in health-related research.

Users of the Adolescent PUF must sign a confidentiality agreement before it can be released or downloaded. This is a statement that commits the user to making appropriate use of the data and so taking extra precautions to protect respondent confidentiality. In order to minimize respondent identification, the information in these files has been carefully reviewed and, when necessary, re-constructed in ways to minimize the risk of respondent identification while retaining their usefulness for research. Some information collected in CHIS also had to be excluded from the Adolescent PUF to protect respondent identity and privacy.

The Adolescent PUF can be used only for statewide estimates and not for local-level (sub-state) estimates. County identification and sub-county geographic information have been intentionally excluded to reduce the risk of respondents being identified. However, five different urban-rural variables are included (each with a slightly different method of classifying respondent residence along an urban-rural continuum).

Although there are no sub-state geographic identifiers, the Adolescent PUF has been designed to maximize other detailed demographic information, such as each respondent's exact age and race and ethnicity. This decision was made to enhance the usefulness of the data for examining the relationship between health indicators and race, ethnicity, and other social and economic characteristics.

CHIS sample weights are included in the Adolescent PUF. Limited technical assistance is also available from CHIS at [chis@ucla.edu](mailto:chis@ucla.edu).

### Accompanying Files

The following describes multiple files included in the package along with the data file. Some are not necessary for data analysis but add convenience in utilizing the main data.

- a. **Data file:** teen.sas7bdat, teen.sav, teen.dta
- b. **Proc format file:** TEEN \_PROC\_FORMAT.SAS
- c. **Format file:** TEEN \_FORMAT.SAS
- d. **Label file:** TEEN \_LABEL.SAS  
For sample codes using Proc format, format and label files, see Section 4.
- e. **Others:** TEEN.XPT
- f. Please contact the CHIS team at [CHIS@ucla.edu](mailto:CHIS@ucla.edu) to access the imputation flag files which identify all imputed values.

## **2. CHIS 2001 Design and Methodology Summary**

### **2.1 Overview**

The 2001 California Health Interview Survey (CHIS 2001) is a collaborative project of the UCLA Center for Health Policy Research, the California Department of Health Services, and the Public Health Institute. The focus of the survey is on a variety of public health topics including access to health care and health insurance coverage. CHIS 2001 is the largest state health survey ever undertaken in the United States. It is a random digit dial (RDD) telephone survey of California households designed to produce reliable estimates for the whole state, for large and medium-sized population counties in the state, and for groups of the smallest population counties. Three California cities that have their own health departments were also sampled as part of CHIS 2001.

The survey design supports study of California's major race and ethnic groups, and a number of smaller ethnic groups within the state. Adults, parents of children below age 12, and adolescents (ages 12-17) residing in California households are the eligible respondents to the survey. CHIS 2001 collected data between November 2000 and October 2001. The plans are to conduct independent cross-sectional surveys of the California population on a biannual basis to monitor important health-related indicators and potentially track changes over time. CHIS 2001 is the first of these planned surveys.

CHIS 2001 collected information on if, where, and how people get health care in California. The objective is to provide health planners, policymakers, state, county and city health agencies, and community organizations with information on the health and health care needs facing California's diverse population. For example, the number and characteristics of adults, children, and adolescents without access to care and lacking health insurance can be estimated from the data collected in CHIS 2001. Other key estimates on the prevalence of cancer screening, diabetes, asthma, and other health conditions can also be produced. The survey includes major content areas such as health status and conditions, health-related behaviors, access to health care services, and health insurance coverage.

### **2.2 Sample Design Objectives**

The CHIS 2001 sample is designed to meet two broad objectives: 1) providing local-level estimates for counties with populations of 100,000 or more; and 2) providing statewide estimates for California's overall population and its larger race/ethnic groups, as well as for several smaller ethnic groups. To address these objectives, the sample was allocated by county and aggregates of smaller counties, with supplemental samples of selected populations and cities. Table 1 shows the sampling strata, i.e., counties and groups of counties that were identified in the sample design as domains for which separate estimates would be produced. A sufficient sample was allocated to each of these domains to support the first objective.

In addition, samples were drawn from three cities that each has its own local health department, and supplemental samples were developed for three counties that contracted for additional sample to enhance their overall estimates. The supplemental geographic samples were:

- Three cities: Berkeley, Long Beach, and Pasadena; and

- Three counties: San Francisco, Santa Barbara, and Solano.

The three city samples and the Solano county supplemental sample were implemented with and incorporated in the original statewide RDD sample. The separate San Francisco and Santa Barbara supplemental samples were subsequently added to the statewide RDD sample prior to constructing the sample weights and are part of the final CHIS 2001 RDD sample file.

**Table 1. California county and county group strata used in the sample design**

Source: UCLA Center for Health Policy Research, 2001 California Health Interview Survey.

To accomplish the second objective — assuring adequate sample sizes for larger race/ethnic groups and some smaller ones, CHIS 2001 used two strategies. First, sufficient sample was allocated to the larger urban counties in which the majority of populations of color reside to generate adequate samples for major ethnic groups of color. Second, supplemental samples were designed to improve the sample size and precision of the estimates for specific ethnic groups. The supplemental ethnic group samples in CHIS 2001 were:

- Asian groups: South Asian, Cambodian, Japanese, Korean, and Vietnamese;
- American Indian and Alaska Natives in urban and rural areas; and
- Latinos in Shasta County.

## 2.3 Data Collection

To capture the rich diversity of the California population, interviews were conducted in six languages: English, Spanish, Chinese (Mandarin and Cantonese dialects), Vietnamese, Korean, and Khmer (Cambodian). These languages were chosen based on research that identified these as the languages that would cover the largest number of Californians in the CHIS sample design who did not speak English or did not speak English well enough to participate in an interview.

Westat, a private firm that specializes in statistical research and large-scale sample surveys, conducted the CHIS 2001 data collection for the CHIS project. Westat staff interviewed one randomly selected adult in each sampled household. In those households with children (under age 12) or adolescents (ages 12-17), one child and one adolescent were randomly sampled, so up to three interviews could have been completed in each sampled household. The sampled adult was interviewed and the parent or guardian who knew the most about the health and care of the sampled child was interviewed. The sampled adolescents responded for themselves, but only after a parent or guardian gave permission for the interview. Since adolescents were not a reliable source concerning their own health insurance coverage, the parents of sampled adolescents were interviewed about this topic separately.

One criterion for the adolescent and child to be selected for the survey is that they had to be “associated” with the selected adult. This meant that in most cases the interviewed adult had to be either the parent or guardian. The CHIS 2001 sample weights adjust for this selection criterion so as not to bias estimates based on the adolescent and child surveys. Table 2 shows the number of completed adult, child, adolescent, and adolescents’ health insurance interviews in CHIS 2001, by the type of sample (RDD or supplemental sample).

The interviews done in English were administered using Westat’s computer-assisted telephone interviewing (CATI) system. Spanish and Vietnamese language interviews were also conducted entirely in CATI, while interviews conducted in Cantonese, Mandarin, Korean, and Khmer used English CATI screens and paper translations in tandem. The average adult interview took around 32 minutes to complete. The average child and adolescent interviews took 14 minutes and 19 minutes, respectively. Interviews in the non-English languages generally averaged longer to complete. Approximately 12% of the adult interviews were completed in a language other than English, as were 21% of all child interviews and 9% of all adolescent interviews.

**Table 2. Number of completed interviews by type of sample, instrument**

| Type of sample   | Adult         | Child         | Adolescent   | Adolescent insurance |
|--|---------------|---------------|--------------|----------------------|
| Total RDD + supplemental cases                             | 57,848        | 13,276        | 6,058        | 8,302                |
| RDD (includes 3 cities + Solano county supplemental cases) | 54,122        | 12,392        | 5,733        | 7,809                |
| Santa Barbara supplemental cases                           | 206           | 49            | 22           | 31                   |

## 2.4 Response Rate

The overall response rate for CHIS 2001 is a composite of the screener completion rate, i.e., success in introducing the survey to a household in order to select a respondent, and the extended interview completion rate, i.e., success in getting the selected respondent to complete the full interview. For the adult survey, the screener completion rate was 59.2% and the extended interview completion rate was 63.7%. This gives an overall response rate of 37.7%. To maximize the survey’s response rate, an advance letter (in five languages) was mailed to all sampled telephone numbers for which an address could be obtained from reverse directory services. Approximately 66% of the sample was mailed an advance letter. Response rates varied by sampling stratum and were slightly higher in households that received an advance letter.

In order to assist in achieving sample size objectives, respondents that completed 80% of the questionnaire, i.e., through Section I on Health Insurance, after all follow-up attempts were exhausted to complete the full questionnaire were counted as “complete.” This resulted in 397 “partial completes” being included in the final adult survey data. Employment and income information as well as potential public program eligibility and food insecurity information would be missing from these cases.

Proxy interviews were allowed for frail and ill persons over the age of 65. The reason is that health estimates made for elderly persons could be biased if this is not allowed. Eligible selected persons were recontacted and offered a proxy option and 316 had a proxy interview completed by either a spouse/partner or adult child. Only a subset of questions identified as appropriate for a proxy respondent were administered. [Note: the questions not administered are identified in their response set as being skipped (denoted by the value of “-2”) because a proxy is responding for the selected person.]

## 2.5 Weighting the Random Digit Dial Sample

In order to produce correct population estimates for the RDD CHIS results, weights are applied to the sample data to compensate for a variety of factors, some directly resulting from the design and administration of the survey. Sample weighting was carried out in CHIS 2001 to accomplish the following objectives:

- Compensate for differential probabilities of selection for households and persons [Note: households with listed addresses and thus eligible for an advance letter were assigned a probability of selection of 1.25 over unlisted households];
- Reduce biases occurring because non-respondents may have different characteristics than respondents;
- Adjust, to the extent possible, for under-coverage in the sampling frames and in the conduct of the survey; and
- Reduce the variance of the estimates by using auxiliary information.

As part of the weighting process for the RDD samples (each stratum is an independent sample), a household weight was created for all households that completed the screener interview. This household weight is the “base weight” computed as the inverse of the probability of selection of the sample telephone number adjusted for each of the following:

- Sub-sampling for listed address/advance letter status;
- Unknown residential status;
- Screener interview non-response;
- Multiple telephone numbers; and
- Household post-stratification.

A “post-stratified household weight” was then used to compute a person-level weight. This person-level weight incorporates the within-household probability of selection of the sampled person and adjusts for non-response, plus an adjustment resulting from raking the data to person-level control totals. Each of these adjustments corresponds to a multiplicative weighting factor.

Raking can be thought of as a multidimensional post-stratification procedure because the weights are basically post-stratified to one set of control totals (a dimension), and then these adjusted weights are post-stratified to another dimension. After all dimensions are adjusted, the process is iterated until the control totals for all the dimensions are simultaneously satisfied.

There were 11 dimensions used in the raking procedure in CHIS 2001. The first 10 dimensions were created by combining demographic variables (age, sex, race, and ethnicity) and different geographic areas (city, county, group of counties, and state). The last dimension was created to adjust the weights for households without a telephone number. The control totals used in the raking were derived from the 2001 population projections for the State and counties provided by the California Department of Finance (DOF). The DOF data enable CHIS to provide current population projections for the State and counties and to use a consistent population data source over time. For additional information on the weighting methods, please see the CHIS 2001 Methodology Series: Report 5 – Revised Weights, available on the CHIS Web site at <http://www.chis.ucla.edu/methods.html>.

## 2.6 Imputation Methods

Three different imputation procedures were used in CHIS 2001 to fill in missing responses that were essential for weighting the data or for such basic descriptive purposes as income categories. The first imputation technique is deterministic or non-stochastic in nature. Deterministic imputation was used to fill in the missing items such as self-reported county of residence (item AH42) that required no randomization because other data are available that can be used to determine the respondent's status (in this example, county of residence) with a relatively high level of probability of being correct although not with 100% certainty in all cases.

The second imputation technique is a completely random selection from the observed distribution. This method is used only when a very small percentage of the items are missing. For example, when imputing the missing values for self-reported age, the distributions of the responses for age by type of interview (adult, child, or adolescent) were used to randomly assign an age using probabilities associated with these distributions.

The third technique is hot-deck imputation. Hot-deck imputation was used to impute race, ethnicity and household income in CHIS 2001. The hot-deck approach is probably the most commonly used method for assigning values for missing responses in large-scale household surveys.

With a hot deck, a value reported by a respondent for a particular item is assigned or donated to a "similar" person who did not respond to that item. In order to carry out hot-deck imputation for CHIS 2001, the respondents to an item form a pool of donors while the non-respondents are a group of recipients. A recipient is matched to the subset pool of donors with the same household structure. The recipient is then randomly imputed the same household income, ethnicity and/or race (depending on the items that need to be imputed) from one of the donors in the pool. Imputation flags are used to identify all imputed values. Please contact the CHIS team to access the CHIS 2001 imputation flag data files at [CHIS@ucla.edu](mailto:CHIS@ucla.edu).

## 2.7 Methodology Report Series

A series of five methodology reports are available with more detail about the methods used in CHIS 2001. The reports are:

- Report 1 - Sample Design
- Report 2 - Data Collection Methods
- Report 3 - Data Processing Procedures
- Report 4 - Response Rates
- Report 5 - Weighting and Variance Estimation

For further information on CHIS data and the methods used in the survey, visit the California Health Interview Survey web site at [www.CHIS.ucla.edu](http://www.CHIS.ucla.edu) or contact CHIS at CHIS@ucla.edu.

### 3. How to use the Data Dictionary

This Data Dictionary describes the variables in the CHIS 2001 Adult PUF. The index of the data dictionary lists variables by the alphabetical order and by the order in the adult survey questionnaire. Please note that identical variable names appearing in the CHIS 2001 and the later year data files does not guarantee identical question wording, response categories or universe; please consult the questionnaires and data dictionaries to assess comparability across cycles. A printable version of the adult questionnaire can be found on the CHIS web site at <http://www.chis.ucla.edu/topics.html>.

The data dictionary contains the following fields:

- **VARNAME** : The names of the variables.
- **QNAME01** : The names of the 2001 survey items. A blank field means the variable is constructed with survey items shown in the **INPUT VAR** field.
- **QPAGENUM** : Location of the question in the CHIS 2001 questionnaire.
- **LABEL** : A description (or label) of the variable which is the same as what is included in the label file described in Section 1.2.
- **VALUE** : Response categories and their sample distributions of categorical variables. The following negative values are used for all variables:
  - 1 : SKIPPED.
  - 2 : PROXY SKIPPED.
  - 5 : ADULT/HOUSEHOLD INFORMATION NOT COLLECTED FOR TEEN AND CHILD INTERVIEWS.
  - 7 : REFUSED.
  - 8 : DON'T KNOW.
  - 9 : NOT ASCERTAINED.
- **MEAN STATISTICS** : Sample distributions of continuous variables.
- **UNIVERSE** : The scope of eligible respondents for the corresponding item. For some questions and variables, certain respondents become ineligible due to skip patterns or other restrictions (e.g., age and sex).
- **INPUT VAR** : Source variables used to construct the one in the **VARNAME** field.
- **NOTES** : Additional information about the variable.

*Note: The public use file does not contain all of the variables in the CHIS 2001 source dataset. Some of these variables are not included in the Public Use File due to confidentiality constraints. Others are excluded because they are replaced by a constructed variable. Therefore, the universe section may refer to variables that are not available in the Public Use File.*

## **4. Sample Code Using Public Use Files**

Sample code to assist with analyses of CHIS data is available on the CHIS website at <http://healthpolicy.ucla.edu/chis/analyze/Pages/sample-code.aspx>.

## 5. Data Dictionary Variable Listings

### A. Alphabetical listing by variable name

| Variable Name | Description  | Page Number |
|---------------|--|-------------|
| AGEGRP A      | AGE GROUP OF ADULT   | DD-97       |
| AHEDU         | ADULT EDUCATION (4 LVLS)   | DD-100      |
| AK1           | WORK STATUS LAST WEEK OF ADULT                                     | DD-100      |
| ASIAN4TP      | ASIAN SUBTYPES (4 LVLS)  | DD-68       |
| ASTSYM        | ASTHMA SYMPTOMS PAST 12 MONTHS                                     | DD-10       |
| BMI           | BODY MASS INDEX  | DD-7        |
